Is Bess the right energy storage solution for your project? The energy storage market is a global one. With the transportation of BESS accounting for up to 15% of a project's cost, careful consideration is needed to ensure the right solution, writes Vienna Zhou, founder and CEO of Canada-based commercial & industrial (C&I) specialised system integrator TROES Corp. Can a 40ft container be used in a Bess project? Standard ISO containers, even the larger 40ft models, have inherent size limitations. This restricts the total energy storage capacity that can be transported in a single container. For large-scale BESS projects requiring high capacity, containerised transport might not be feasible. Why is modular transport better than containerised transport? Lastly, modular transport offers greater adaptability than containerised transport, which can be limited by port infrastructure or access roads. Individual components can be delivered by various methods, such as trucks, trains, or even barges, depending on the site accessibility and project requirements. How is a Bess system transported? Customised BESS systems or half-completed systems are typically transported in a modular fashion. This involves breaking down the system into its components, such as battery racks, enclosures, and power conversion systems (PCS). These components are then shipped separately and reassembled at the destination site.
